

Strong States, Weak Elections?

**How State Capacity in Authoritarian Regimes Conditions the Democratizing
Power of Elections**

1. Introduction

As many autocracies in the world today hold multiparty elections (Croissant and Hellmann, 2016), it is critical to understand the conditions under which elections lead to democratization.

On the one hand, democratization-by-elections research argues that repeated elections, even when held in authoritarian contexts, eventually lead to democratization (Lindberg, 2006, 2009, Howard and Roessler, 2006, Edgell et al., 2015). Indeed, in countries as varied as Tunisia, Ghana, and Mongolia, the introduction of multi-party elections has generated increased civil liberties, deepened respect for the rule of law, and regular turnover of the national executive (Lindberg, 2006, Stepan, 2012). On the other hand, cases such as Malaysia, Russia, and Cameroon demonstrate that elections in authoritarian regimes can be subverted to such an extent that they strengthen, rather than weaken, authoritarian rule (Gandhi and Lust-Okar, 2009, Levitsky and Way, 2010, Schedler, 2002, 2013). Clearly, elections can both sustain and undermine authoritarianism, begging the question: What factors condition the relationship between elections and democratization?

We argue that state capacity is one of the factors affecting the democratizing power of elections in authoritarian regimes. Scholars have argued that developing strong state institutions is an important pre-condition for successful democratization, both by preventing instability and conflict in transitional regimes as well as by enabling newly democratic governments to gain legitimacy by providing public services (Fukuyama, 2014, Mansfield and Snyder, 2007, Fortin, 2012, Mazucca and Munck, 2014). However, state capacity in authoritarian regimes may also prevent instability and conflict, sustaining authoritarianism by strengthening autocrats' capacity to manipulate support and oppress dissent (Seeberg, 2014, Way, 2005, Slater, 2012). State capacity might be equally important for both democratic and autocratic stability (Andersen et al., 2014b, Slater and Fenner, 2011).

We build on insights from research on state capacity, democratization and electoral authoritarianism to develop a theory of how state capacity conditions the democratizing power of elections. We argue that, ultimately, whether state capacity undermines or reinforces democratization depends on who is exercising the capacity of the state and to what end. Hence, we propose a two-phase theory of democratization-by-elections that considers the differential effects of state capacity on turnover in elections and democratic change after elections. We hypothesize that state capacity has a *negative* effect on the likelihood of regime turnover, but a *positive* effect on democratic change

after elections. In authoritarian regimes with weak state capacity, manipulating elections, repressing opposition, and co-opting elites may be more difficult than in authoritarian regimes with strong state capacity. Hence, we expect elections in regimes with weak state capacity to be more likely to lead to incumbent turnover. However, after turnover, if the new incumbent has limited capacity to deliver public services and make policy changes after coming to power, democratic change is unlikely to be sustainable.¹ Hence, in authoritarian regimes, state capacity can either reinforce or undermine the democratizing power of elections, depending on the stage at which it is being applied.

In the next section, we develop our theoretical argument and hypotheses about the relationship between state capacity, elections, and democratization. We then present our data and methods in Section 3 and proceed to test the hypotheses on a sample of 460 elections in 110 electoral authoritarian regimes from 1974 to 2012 using new data from the Varieties of Democracy (V-Dem) dataset (version 6.1). Section 4 presents the results of our empirical analyses. In the final section we conclude with a discussion of the results and suggestions for future research.

2. State capacity, elections, and democratic change in authoritarian regimes

Extensive research has been conducted on how elections might lead to democratization or, conversely, sustain authoritarianism. Historical research on elections in fledgling democracies in Europe, the United States and Latin America demonstrates that elections were subverted in a variety of ways, from co-optation of ruling elites, to exclusion of opposition parties and voters, to electoral manipulation (Lehoucq, 2003, Mickey, 2015, V.O. Key, 1949, Evans, 1989).ⁱⁱ Likewise, during the Cold War authoritarian regimes would often limit party and candidate participation in elections (when held at all) to such an extent that elections were single-party elections or plebiscites, aimed at re-confirming and consolidating incumbents rather than providing opportunities for genuine contestation (Hermet et al., 1978, Magaloni and Kricheli, 2010). More recently, the spike in electoral authoritarian regimes after the end of the Cold War that use a variety of strategies to manipulate elections (Levitsky and Way, 2010, Schedler, 2002, 2013, Lehoucq, 2003) suggests that elections can indeed be useful instruments to promote authoritarian stability (Gandhi and Lust-Okar, 2009, Magaloni and Kricheli, 2010).

Conversely, research on the struggles for electoral reform in countries such as the US and Mexico has shown not only how elections enabled authoritarian regimes to persist, but also how elections eventually opened opportunities for democratization (Mickey, 2015, Magaloni, 2006). Likewise, many of the authoritarian regimes that started holding

multiparty elections after the end of the Cold War did democratize, albeit sometimes through protracted periods of transition (Lindberg, 2006, 2009).ⁱⁱⁱ Regime change by elections has become increasingly frequent in authoritarian regimes (Croissant and Hellmann, 2016).

Hence, better understanding the conditions under which elections contribute to democratization of authoritarian regimes is critical.^{iv} In this paper, we focus on state capacity as one of the conditions mediating the relationship between elections and democratization. In order to understand the role of state capacity in strengthening or weakening the democratizing power of elections, we first map the causal connections between state capacity, elections, and democratic change.^v

Figure 1 illustrates the relationships between state capacity, elections and democratic change. In order to clarify our argument, it is important to distinguish: (i) how elections influence democratic change; (ii) how state capacity influences democratic change; and (iii) how state capacity might condition the relationship between elections and democratic change. As we elaborate below, state capacity can affect prospects for democratic change directly (Figure 1) as well as condition the effect of elections on democratic change (Figure 2).

[Figure 1 about here]

(i) Elections and democratic change

As the relationship between elections and democratic change is not the theoretical or empirical focus of this article, we only briefly summarize the primary arguments in the literature here for purposes of anchoring the discussion. Elections can affect democratic change in two ways. First, elections can generate democratic change by generating incremental changes in some components of democracy that lead to improvements in overall democratic quality. Repeated experiences with elections can encourage the practice of democracy among citizens, and expand media freedom and civil liberties, changes that might be difficult to turn back after the elections are over (Lindberg 2006, 2009).

However, elections can also lead to democratization by generating incumbent turnover in elections, creating a possibility for citizens to ‘throw the rascals out’ if they are dissatisfied with the incumbent government (Huntington, 1991: 174). Of course, in electoral authoritarian regimes this possibility may be very small, but even autocrats sometimes lose elections, creating a window of opportunity for political change (Levitsky and Way, 2010, Schedler, 2013).

(ii) State capacity and democratic change

The state and state capacity have been conceptualized in many different ways (Hanson, 2016, Andersen et al., 2014a). Following the Weberian tradition, we define the *state* as “an entity that successfully claims a monopoly on the legitimate use of force within a specified territory” (Weber, 1918). *State capacity* is defined as “the ability of state institutions to effectively implement official goals” (Sikkink, 1991). Following Hanson (2016), we distinguish between three types of state capacity: coercive capacity, administrative capacity, and extractive capacity. While coercive capacity relates to states’ capacity to maintain their monopoly of power and deliver a minimum level of security for citizens (Mansfield and Snyder, 2007, Fukuyama, 2004), administrative capacity refers to states’ capacity to implement policies and deliver basic public services (Andersen et al., 2014a).^{vi} Extractive capacity refers to states’ capacity to collect resources, which is important for sustaining both coercive and administrative capacity. In practice, authoritarian regimes vary in terms of their capacity on these three dimensions, and this variation determines what strategies for ensuring regime stability are available to incumbents (Slater and Fenner, 2011, Andersen et al., 2014b).^{vii}

We argue that authoritarian rulers can use state capacity to strengthen their power base in three ways: first, by generating genuine support; second, by fabricating support; and third, by oppressing dissent. Firstly, state capacity enables incumbents to *generate*

genuine support by providing security and other public services, such as education or health services (Slater, 2012, Slater and Fenner, 2011). Secondly, state capacity also allows incumbents to *fabricate support* by manipulating elections, distorting information provided by the media, and co-opting ruling elites, opposition and citizens (Seeberg, 2014). Thirdly, state capacity can be used to *oppress dissent* by legal prosecution, intimidation, or even jailing and eradicating opposition actors, journalists, and critical citizens (Seeberg, 2014, Gandhi and Lust-Okar, 2009, Schedler, 2013).

The three different types of state capacity can be used by authoritarian incumbents to generate genuine support, fabricate support, or oppress dissent. For example, coercive state capacity can be used to guarantee security for citizens (generating genuine support) as well as to limit opposition to the incumbent (oppressing dissent). Likewise, administrative state capacity can be used to deliver public services to citizens (generating genuine support), as well as to manipulate elections (fabricating support). Finally, extractive state capacity can be used to fund public services (generating genuine support), as well as for co-opting elites and citizens that may otherwise oppose the incumbent (fabricating support). In practice, many different combinations of types of state capacity and target audiences will be possible, but in general, we expect that strong state capacity should strengthen the support base of electoral authoritarian incumbents.

Hence we would expect democratic change to be less likely in electoral authoritarian regimes with strong state capacity (Hanson, 2016).^{viii}

In short, authoritarian incumbents can use state capacity to prevent democratic change and stabilize their power. As Figure 1 illustrates, this can affect prospects for democratic change *directly*, regardless of whether elections are held or not. For example, co-optation of ruling elites and citizens can ensure loyalty and support for incumbents in the period between elections and can lower the risk of coups, protests, and even revolutions or civil war, and coercion of the opposition serves the same purpose of maintaining stability of the regime, regardless of whether elections are being held.^{ix} Hence, we would expect state capacity in authoritarian regimes to lower the prospects of democratic change even external to elections.

(iii) How state capacity conditions the democratizing power of elections

When it comes to understanding how state capacity affects elections, and more specifically, the democratizing power of elections, it is important to disaggregate democratization-by-elections into two phases, separating incumbent turnover from democratic change after elections. Here, we define incumbent turnover to be the election of a different ruling party, and we define democratic change as a net shift towards democracy in the years following the election. We advocate for this two-phase

approach because whether state capacity undermines or reinforces democratization depends on who is exercising the capacity of the state and to what end (Slater and Fenner, 2011). In considering what leads to incumbent turnover, state capacity is in the hands of an authoritarian incumbent. In this phase, we anticipate state capacity is used to retain power, making turnover and democratization less likely. However, after turnover has occurred in an election, state capacity is in the hands of a newly elected regime. Though this regime may also use state capacity to build power, we assert that it is more likely that state capacity would be skewed towards generating genuine support in this phase. Therefore, we theorize that state capacity has opposing effects in these two phases, and hence it is critical to separate both phases when investigating the effects of state capacity empirically.

Starting with turnover, in elections in authoritarian regimes, strong state capacity can enable incumbents to engage in generating genuine support, fabricating support, and oppressing dissent. For example, strong state capacity allows incumbents to ramp up delivery of public services and goods in the months leading up to the elections, to target clientelism, to co-opt elites by promises of access to and redistribution of state resources after the elections, to intimidate opposition and voters and oppress independent sources of information, and to manipulate electoral institutions such as electoral management bodies to deliver results in favor of the incumbent (Gandhi and

Lust-Okar, 2009, Schedler, 2013, Seeberg, 2014, Hellmann, 2016). Hence, we would expect strong state capacity to significantly lower the chances of turnover in authoritarian elections. Elections held in electoral authoritarian regimes with strong states as Malaysia, Singapore, and Russia provide illustrative examples of this logic. Conversely, we would expect weak state capacity to increase the likelihood of turnover in authoritarian elections, as illustrated by elections in regimes with weaker state capacity such as Haiti, Bangladesh, and Comoros.

However, while weak state capacity may increase the probability that elections trigger incumbent turnover, subsequent democratic change may be *less* likely in regimes with limited state capacity. Since the consequences of state capacity depend on which actors are in power and what political objectives they seek to achieve, if elections in authoritarian regimes bring a ‘democrat’ to power, however unlikely, strong state capacity would be important in supporting the new incumbent’s attempts at further democratic change. A democratic leader attempting to generate genuine support would need strong extractive capacity to fund large-scale public goods, strong administrative capacity to follow through on a programmatic agenda, and strong coercive capacity to enforce the rule of law and depart from the previous autocratic status quo. Hence, what may be needed for democratic change after elections is the (unlikely) combination of incumbent turnover and a strong state.^x

Therefore, we expect state capacity to be positively associated with democratic change after elections, but *only* if the elections resulted in incumbent turnover. Figure 2 provides an illustration of the expected relationships between state capacity, incumbent turnover and democratic change after elections.

[Figure 2 about here]

Summarizing our hypotheses, our hypothesis for the *direct* effect of state capacity on democratic change in electoral authoritarian regimes is:

H1 – State capacity is associated with a lower likelihood of democratic change.

Our hypotheses for the *conditional* effects of state capacity on the democratizing power of elections in electoral authoritarian regimes are:

H2 - State capacity is associated with a lower likelihood of turnover in elections.

H3 - State capacity is associated with a higher likelihood of democratic change after elections that resulted in turnover.

3. Data and Methods^{xi}

The hypotheses outlined in the previous section are tested with new data from the Varieties of Democracy (V-Dem) dataset, version 6.1 (Coppedge et al., 2016a,b,c) and the Quality of Government dataset (Teorell et al., 2015), as well as data on state capacity from Hanson and Sigman (2013).^{xii}

Sample Selection

As our theoretical argument focuses on authoritarian elections, we limit our sample to electoral authoritarian regimes. We use the V-Dem liberal democracy index that classifies regimes along a continuum from very authoritarian (0) to very democratic (1).^{xiii} We consider all regimes that hold elections and score lower than 0.5 on the liberal democracy index to be electoral authoritarian regimes and include them in our analysis.^{xiv} This cutoff means some ambiguous cases on the border between electoral authoritarianism and electoral democracy might be included, but assures inclusion of all electoral authoritarian regimes.^{xv} We exclude closed autocracies that did not hold multiparty elections for the national executive and exclude countries that were not fully independent.^{xvi} We further restrict the sample to national-level elections for the executive. Hence, in presidential regimes we include presidential elections and in parliamentary regimes we include parliamentary elections.^{xvii} These choices leave a

sample of 460 executive elections that took place between 1974 and 2012 in 110 countries around the world, resulting in a total of 3116 country-year observations.^{xix}

Dependent variables

Tables A and B in the online Appendix show summary statistics for all variables. The analyses include two dependent variables: incumbent turnover in elections and democratic change after elections.

Turnover is measured using the V-Dem variables capturing turnover in the head of government and turnover in the head of state. We code elections as having resulted in turnover when the head of state or head of government lost their position(s) as a result of the outcome of the election. In presidential systems, this code applies when the new president is both a different person and from a different party (or independent) than was in power before the election. In parliamentary systems, this code applies when the ruling party or coalition of parties lost and the new head of government is from a different party or from a new coalition (Coppedge et al., 2016b).^{xx} In our sample, 34% of elections resulted in turnover.^{xxi}

We measure democratic change by calculating the change in the regime's democracy score in the two years after the elections.^{xxii} The democracy score we use is the V-Dem

liberal democracy index described before, that classifies regimes along a continuum from very authoritarian (0) to very democratic (1).^{xxiii} In the models with democratic change as the dependent variable, we include lagged democracy level (t-1) as an independent variable to mitigate possible ceiling effects.^{xxiv}

Independent variables

Our main independent variable of interest is state capacity. We use the measure of state capacity developed by Hanson and Sigman (2013) for three reasons. First, it combines the three dimensions of state capacity discussed – extractive capacity, coercive capacity, and administrative capacity – into a single measure of state capacity.^{xxv} Second, it offers the greatest coverage in years and countries, as it incorporates measures of state capacity from multiple sources. Third, missing data is imputed rather than list-wise deleted.^{xxvi} In the models explaining turnover, state capacity is lagged so it is measured in the year before the election; in the models explaining democratic change after the election, we measure state capacity in the year of the election.

Controls

In models explaining turnover, we include several control variables associated with turnover in elections. As turnover is more likely if economic performance is unsatisfactory (Anderson, 2007), we include GDP per capita (in current US dollars) and

economic growth per capita (% annual GDP growth per capita).^{xxvii} Clarity of responsibility, required for voters to hold incumbents accountable for bad performance, is considered to be higher in presidential (vs. parliamentary) systems (Anderson, 2007), so presidentialism is included as a control variable.^{xxviii}

In models explaining democratic change, we include control variables that have commonly been found to be associated with democratization in previous research (Przeworski et al., 2000, Lindberg, 2006, Teorell, 2010). We include control variables for the level of economic development (measured as GDP per capita in current US dollars) and economic growth (measured as % annual GDP growth per capita), because previous research has found that greater economic development but lower growth rates are conducive to democratization (Przeworski et al., 2000). We include control variables indicating whether a coup d'état or civil war occurred in the year before the elections because previous research has found both to negatively affect democratization (Lindberg, 2006). We include controls for ethnic and religious fractionalization, whether the country has a presidential or parliamentary form of government, and whether the country is a former British colony, because previous research has found that ethnic and religious fractionalization undermines democratization (Teorell, 2010), that presidentialism negatively affects prospects for democratization (Przeworski et al., 2000), and that former British colonies tend to have better prospects for

democratization (Teorell, 2010). Data on level of economic development and growth are derived from the World Development Indicators, data on coup d'états and civil war from the V-Dem dataset and data on the other control variables from the Quality of Government dataset (Teorell et al., 2015).^{xxix}

We do not include the level of foreign aid and the level of natural resources as controls when predicting democratic change, as we anticipate these to be intervening variables in the relationship between state capacity and democratic change. Similarly, we do not include intervening variables that are associated with elections and democratization, such as co-optation of elites and citizens, oppression of the opposition, and electoral manipulation. These variables are part of the causal mechanisms we are positing, meaning that we expect state capacity to shape turnover in elections and democratic change *through* these variables, and the multicollinearity between these variables and state capacity would render the effect of state capacity insignificant in regression analysis.

We lag all included control variables by one year, so they are measured the year before the elections took place.

Empirical Strategy

Our empirical strategy has two sections. First, in order to test whether there is a direct negative effect of state capacity on democratic change (H1), the first section of our analysis predicts democratic change in all country-years, regardless of the incidence of an election. These analyses are carried out using time-series cross-sectional ordinary least squares regression with country fixed effects, and results are presented in Table 1 in the next section. As we are testing for a direct effect of state capacity on democratic change, in these analyses we consider all country-years in our sample, regardless of whether elections were held or not.

To test whether there is a negative effect of state capacity on turnover in elections (H2), we first test the effect of state capacity on turnover, using time-series cross-sectional logistic regression with regional fixed effects for turnover models.^{xxx} Then, in order to test whether there is a positive effect of state capacity on democratic change after elections with turnover (H3), we model turnover and democratic change simultaneously as part of a two-step equation. We use a treatment effects model to test first, how state capacity affects turnover (selection model) and subsequently, how state capacity affects democratic change once turnover has taken place (regression equation).^{xxxii} A treatment model is an appropriate test for our hypothesis about the two-stage nature of democratization-by-elections, where elections first need to lead to incumbent turnover in order to open possibilities for wider post-election democratic change. Since these

analyses zoom in on the consequences of elections, the sample is limited to election years. Results for these analyses are presented in Table 2 in the next section.

Robustness checks of the analyses are discussed in the endnotes and reported in the online Appendix.

4. Results

Table 1 shows the results of the analyses testing the direct effect of state capacity on democratic change (H1), as illustrated in Figure 1.

[Table 1 about here]

As model 1 shows, in our sample of electoral authoritarian regimes, state capacity negatively affects democratic change, supporting H1. This effect is robust to the inclusion of controls (models 2 and 4) and the election variables commonly included in the democratization-by-elections literature (models 3 and 4). To summarize these findings, state capacity has a negative direct effect on democratic change, while elections have a positive direct effect on democratic change. The democratizing power

of elections is strongest when elections resulted in turnover and when elections occurred in high state capacity states.

Table 2 models the impact of state capacity on democratization-by-elections as a two-phase process. We first predict the effect of state capacity on turnover in models 1 and 2. Models 3 and 4 report the results when turnover and democratic change are modeled simultaneously in a treatment effects model, where turnover is the dependent variable of the selection equation and democratic change is the dependent variable of the regression equation.

[Table 2 about here]

As model 1 shows, lagged state capacity has a strong negative effect on incumbent turnover. This effect is robust to the inclusion of control variables in model 2. A plot of the marginal effects of state capacity on turnover shows that at higher levels of state capacity, turnover is much less likely to occur (Figure 3). These results suggest that state capacity is an important factor shaping whether authoritarian elections result in turnover, and that greater state capacity may be detrimental for turnover, supporting H2.

[Figure 3 about here]

In models 3 and 4, we model turnover and democratic change as a two-stage process using a treatment model. The results of the selection model indicate the expected strong negative effect of state capacity on turnover, though the strength of the effect is somewhat diminished in comparison to models 1 and 2. The results of the regression model indicate that turnover has a significant positive effect on democratic change in years after elections. Moreover, if elections result in turnover, state capacity has a substantively small yet statistically significant positive effect on democratic change in electoral authoritarian regimes. Hence, the results in Table 2 appear to confirm H2 and H3. State capacity decreases the likelihood of turnover in authoritarian elections but increases post-election democratic change once turnover occurs.

We ran a series of robustness checks using different criteria for sample selection, using different measures for the dependent variables, and using a different measure for state capacity. The results of these tests are reported in the online Appendix to this paper. In brief, H1 appears to be robust to alternative model specifications: state capacity significantly lowers the likelihood of democratic change, regardless of whether elections were held or not. Only in models using the Polity IV < 0 score as a sample selection criterion and in models with the alternative measure of state capacity was the

effect of state capacity insignificant, though still negative. H2 and H3, about the conditional effect of state capacity on the democratizing power of elections, appear to be partially confirmed in the robustness checks. The clear negative effect of state capacity on turnover in elections (H2) is robust to alternative model specifications. However, the positive effect of state capacity on democratic change after turnover has occurred (H3) does not always hold in robustness checks and the effects are substantively small.

5. Conclusion

Under what conditions do elections lead to democratization or, conversely, sustain authoritarianism? We posit that state capacity is a key factor conditioning the democratizing power of elections in authoritarian regimes, making turnover in elections less likely but making democratic change subsequent to turnover more likely. Using new data from the Varieties of Democracy project, we test the effect of state capacity as an intervening variable in the relationship between elections and democratization.

The results suggest that state capacity has a negative direct effect on democratic change in authoritarian regimes. When it comes to the extent to which the democratizing power of elections is conditioned by state capacity, we modeled a two-stage process, first

examining the effect of state capacity on turnover in elections, and then evaluating the effect of state capacity on democratic change once turnover had occurred. The results indicate that state capacity significantly lowers the likelihood that elections will result in turnover, providing support for our hypothesis. Further, after elections that result in turnover, our findings suggest the effect of state capacity on democratic change is positive. Though turnover in elections is less likely in authoritarian regimes with strong state capacity, if elections do result in turnover in these regimes, state capacity enables new incumbents to consolidate democratic change.

However, the negative effect of state capacity on turnover is substantively larger than the positive effect of state capacity on democratic change once turnover occurred, suggesting that the net effect of state capacity on the democratizing power of elections may be negative. While state capacity could be helpful for sustaining democratic change after elections that result in turnover, the negative direct effect of state capacity on democratic change, as well as the negative effect of state capacity on turnover in elections, may translate into an overall negative net effect of state capacity on shifts towards democracy in authoritarian regimes. This composite picture suggests that “strong state first” theories of democratization may need to be qualified. While state capacity is clearly important to consolidate democratic change once democratic incumbents come to power, it is only if and when such incumbents come to power that

state capacity helps to promote democratic change. In the hands of authoritarian incumbents, state capacity both limits the likelihood of democratic change directly and undermines the capacity of elections to generate turnover, thereby hindering democratization overall. Our findings reinforce the idea that policy efforts to build state capacity should be executed carefully, mindful of this precarious tipping point between building state capacity that might reinforce authoritarian control and building state capacity that can enhance democratization.

A number of caveats to these findings are in order. In the analyses presented here, we have analyzed the relationship between state capacity, turnover, and democratic change with a relatively short-term perspective. We focus our analysis on short-term causal effects such as the relationship between state capacity and regime turnover one year later, and then the subsequent democratic change in the years immediately following elections. There are valid causal inference reasons for doing so, as examining democratic shifts over a longer time period would result in the inclusion of multiple elections, potentially confounding cause and effect. However, it is possible that state capacity affects democratization-by-elections through more long-term causal mechanisms, as those who posit “creeping democratization” would suggest. A better understanding of the role of state capacity in promoting or hampering such long-term processes would be an interesting venue for future research.

This leads to the second caveat, which is that we have considered democratic change here as shifts of regimes in the direction of democracy, conceiving of regimes to be located along a continuum from authoritarian to democratic, and allowing positive democratic change to serve as an indication that democratization-by-elections is succeeding. However, some would argue that successful democratic change is only achieved when democratic change is substantial enough to shift regimes from being classified as electoral authoritarianism regimes to being classified as electoral democracies. Future research exploring how elections and state capacity interact in generating full regime change across different regime types could give a more complete picture of the role of elections and state capacity in cultivating democratization.

Finally, an interesting venue for future research would be to investigate the specific causal mechanisms through which state capacity affects the democratizing power of elections, for example by disaggregating state capacity into its three components of administrative, coercive, and extractive capacity. Currently, cross-national data on state capacity is scarce, and data on its specific components even more so, limiting analyses to a small (and non-random) sub-set of electoral authoritarian regimes for which such data are available. The new Hanson and Sigman (2013) data ameliorates this situation by using multiple data sources and Bayesian latent variable analysis to generate high

quality comparative data on state capacity, but more detailed data on the disaggregated components of state capacity are still lacking. Future research collecting large-N cross-national data on these dimensions would be highly valuable, and could shed more light on the causal mechanisms connecting state capacity, election outcomes, and democratic change.

Recognizing these caveats, the findings presented in this paper nonetheless imply several policy implications. Our findings provide evidence that the positive effects of state capacity for democratization may only occur under specific circumstances, i.e., after a democratic incumbent has come to power, suggesting that strengthening state capacity in authoritarian regimes is not necessarily good for democratization. Of course, strengthening state capacity might be beneficial to achieve other goals such as security and efficient public service delivery, but the empirical evidence presented here suggests that in electoral authoritarian regimes, investments in state capacity with the goal of democratization will likely have to be complemented by other interventions aimed at promoting turnover in elections, such as increasing the integrity of elections and supporting opposition.

Notes

ⁱ Incumbent turnover in elections does not guarantee broader democratic change (as elections may bring new autocrats to power), but it does at least create a possibility for democratic change if the new incumbent(s) is/are democratic.

ⁱⁱ The widespread vote-buying and (formal) voter disenfranchisement in the UK before the Great Reform Act (Evans, 1989); the use of single-party elections, (de facto) voter disenfranchisement, and elite co-optation in the Southern states in the US before WWII (Mickey, 2015, V.O. Key, 1949); and hegemonic party rule in Mexico (Magaloni, 2006) are illustrative examples of how elections can be used to respectively limit democracy, disguise authoritarian practices, and strengthen authoritarianism. For an excellent overview of historical cases of electoral manipulation in Latin America and Europe, see Lehoucq (2003).

ⁱⁱⁱ The empirical evidence on democratization-by-elections is mixed. A recent study on a global sample of elections suggests that democratization-by-elections occurred mainly in the third wave, and mainly in Africa and post-communist Europe, finding weaker or no effects in other regions and time periods (Edgell et al., 2015).

^{iv} In electoral authoritarian regimes, regime change can be triggered by elections, but also by other factors, such as coup d'états, civil conflict, revolutions, or transitions 'from above' initiated by incumbent regime elites. As regime change by elections has become increasingly frequent (Croissant and Hellmann, 2016), we focus on the role of elections in this paper. We include coup d'états and civil wars in our empirical analyses as control variables.

^v The primary outcome variable under consideration in this paper is *democratic change* rather than *democratization*. Conceptualizing our outcome variable as democratic change allows us to consider authoritarian regimes that shift towards democracy (i.e., if we conceive of regimes as varying on a

continuum from authoritarian to democratic) without necessarily fully democratizing (i.e., without passing a threshold on the regime continuum that justifies classification as an electoral democracy instead of an electoral authoritarian regime). This approach therefore also allows us to record smaller shifts towards democracy. We argue that this outcome variable is more in line with the democratization-by-elections literature, which posits that elections can move towards democracy through small, incremental changes.

^{vi} Administrative capacity refers purely to the ability of states to “plan and execute policies” (Fukuyama, 2004), not to whether those policies were executed in an impartial manner. Hence, administrative capacity according to this definition excludes notions of impartiality and the rule of law, which would generate conceptual overlap between state capacity and democracy (Mazucca and Munck, 2014).

^{vii} State capacity is also likely to vary within countries, as some regions may have stronger state capacity than others, which may sustain “authoritarian enclaves” within regimes (Gibson, 2013, Mickey, 2015). However, lacking comparative data on sub-national variation in state capacity, this paper focuses on national-level state capacity.

^{viii} The range of options available to incumbents is not only determined by the capacity of state institutions as defined here, but also by “the extent to which these institutions can be controlled by the dictator” (Hanson, 2016). Variation in regime control over the state is covered in other articles in this special issue (see Hellman 2016 and White 2016).

^{ix} See also Hellmann, 2016 and Mietzner, 2016.

^x See note i.

^{xi} Replication data and code are available on the authors’ websites: *[Insert links]*

^{xii} The exact question wording and answer categories of all V-Dem variables can be found in the V-Dem codebook (Coppedge et al., 2016b).

^{xiii} The V-Dem liberal democracy index is a new index of democracy developed by the Varieties of

Democracy project. The index is based on a combination of indicators for electoral and liberal democracy from the Varieties of Democracy dataset, including: “political and civil society organizations can operate freely; elections are clean and not marred by fraud or systematic irregularities; elections affect the composition of the chief executive; in between elections, there is freedom of expression and an independent media; and there are constitutionally protected civil liberties, strong rule of law, an independent judiciary, and effective checks on the exercise of executive power.” (Coppedge et al., 2016b). The resulting index scores political regimes on a continuum varying from 0 (very autocratic) to 1 (very democratic). For the exact indicators used in constructing the liberal democracy index, see Coppedge et al., 2016b.

^{xiv} We choose 0.5 as the cut-off point because it corresponds to the median of the V-Dem liberal democracy index. Also, since the boundaries between electoral authoritarian regimes and electoral democracies are somewhat fuzzy, and many different regime classifications exist (Levitsky and Way, 2010, Schedler, 2002, 2013, Howard and Roessler, 2006), we prefer to err on the inclusive side and include in our analysis all regimes that fall on the authoritarian side of the V-Dem liberal democracy index.

^{xv} We test the robustness of our findings on a sample following Schedler’s (2002) operationalization of electoral authoritarian regimes, which defines regimes as electoral authoritarian when their average Freedom House political rights and civil liberties score is between 4 and 7. Freedom House data are derived from the Freedom in the World reports, an annual comparative assessment of political rights and civil liberties that covers over 190 countries worldwide. Countries are assigned two ratings – one for political rights and one for civil liberties – based on a scale from 1 to 7, with 1 indicating most free and 7 indicating least free. See: <https://freedomhouse.org/> for more information. Results are substantively similar.

^{xvi} We also check the robustness of our results when using a sample of regimes with Polity IV scores below 0. The Polity IV dataset covers all independent states over the period 1800-2015 and scores these states along a continuum from “fully institutionalized autocracies” (-10) to “fully institutionalized democracies” (+10). We take the mid-point of the scale as our cut-off point, including regimes that score 0 or lower on the Polity IV scale as electoral authoritarian regimes. See: <http://www.systemicpeace.org/polityproject.html> for more information. Results are substantively similar.

^{xvii} We also exclude autocracies that held single party elections, as such regimes cannot experience incumbent turnover. In our analysis, having elections is a scope condition for inclusion in our sample. There is a vibrant literature regarding why authoritarian regimes hold elections demonstrating that elections can provide information to the regime, enable the incumbent to co-opt the opposition and manage elite coalitions, provide domestic and international legitimacy, etc. (Gandhi and Lust-Okar, 2009, Magaloni and Kricheli, 2010). For purposes of focusing our research, we set aside understanding why the regimes in our sample have opted to hold elections and take this as given.

^{xviii} Robustness checks using a sample including all national-level parliamentary and presidential elections (i.e., also including parliamentary elections in presidential regimes) result in substantively similar findings.

^{xix} We include elections as of 1974, as this is when the third wave of democratization started and multiparty elections in authoritarian regimes became more common (Huntington, 1991, Schedler, 2002).

^{xx} Robustness checks were carried out using only turnover of the head of government, and results are substantively the same.

^{xxi} This is 28% if we restrict turnover to only include turnover of the head of government.

^{xxii} We test the robustness of results using democratic change in the three years after the elections, but do not investigate longer time periods, as this may lead to the inclusion of the next election in the measure of democratic change, thus confounding cause and effect in the estimates.

^{xxiii} We test the robustness of our models using V-Dem's more narrowly defined electoral democracy index as well. Results are substantively similar.

^{xxiv} We made this measurement choice because the scope for democratic change may be smaller in regimes that are more democratic already. In fact, the correlation between positive democratic change after elections and the level of democracy in the year before elections is -0.23, providing evidence of a possible "ceiling effect."

^{xxv} Ideally, we would have preferred to have data on state capacity that measures each of these dimensions separately. However, specific data on coercive, administrative and extractive capacity tends to cover only a limited set of countries and years (see Andersen et al., 2014b), and would therefore severely limit the sample of electoral authoritarian regimes that we would be able to analyze. Moreover, Hanson and Sigman (2013) find in their latent variable analyses of multiple indicators of state capacity that the three dimensions are highly correlated and propose using a single index of state capacity.

^{xxvi} We test the robustness of our results with an alternative measure of state capacity from the V-Dem dataset. In this analysis, we use the V-Dem variable "State Authority Over Territory," defined as "Over what percentage (%) of the territory does the state have effective control?" as a proxy for state capacity. Results are substantively similar.

^{xxvii} Downloaded 22 February 2016. URL: <http://databank.worldbank.org/data/>

^{xxviii} Turnover in elections is also likely to be affected by the availability of viable opposition candidates (Anderson, 2007). Also, the level of electoral fraud can affect the likelihood of turnover. However, we do not ultimately control for the availability of viable opposition and the level of electoral fraud, as both of these variables likely lie on the causal pathway from state capacity to turnover as intervening variables, and their inclusion would result in multicollinearity in our models. In other words, as discussed in our theoretical section, it is *through* election fraud and suppressing opposition, among other mechanisms, that authoritarian regimes might use state capacity to reduce the likelihood of turnover.

^{xxix} Ethnic and religious fractionalization and colonial history are time invariant, and therefore models with fixed effects already control for these potential confounders.

^{xxx} A Hausman test indicates random effects are appropriate for the turnover models and fixed effects are needed for the democratic change models.

^{xxxi} We use a treatment effect model rather than a Hausman selection model since we have outcome data for both treated and non-treated groups (i.e., elections with and without turnover).
